

Emily Tran  
Professor Li  
Junior Seminar  
8 April, 2018

[My document is clearly unfinished. There is a lot of Javascript that I have to figure out. I will be using one of the redo's for this assignment.]

The intended audience for this document is the general crowd who likes to read and play with visual content. I don't plan on including mathematical equations or statistics for intellectually advanced people to geek over, but I do hope that this document will add new perspective to the audience about the complications of parking well. I want users to play around with the parameters to find out that there is no perfect solution to parking given the uncertainty and variety of the world in general. I might make the resolution of the document more lighthearted rather once I figure out how to do. As the user walks through the document, the user will be able to play around with more variables that make perfect parking more difficult. The document will give the user proposed solutions (e.g. parking lines) only for the user to find out that the solutions might not work for every situation. The user will then understand the complications of parking well.
